The PHP ROSA company is a leading Polish manufacturer of tubes commonly used in orchard and nursery practice today. The quality of our products is constantly monitored by plastic industry technologists, who take into account the needs of practitioners - fruit growers. Thanks to this, we have created a range of products that ensures stable and safe plant support in the growth and fruiting phase. All products are made of high quality soft PVC, a raw material characterized by durability in weather conditions. In addition, we care for the high quality of our products to follow the ongoing climate change.

The hoses are durable, soft and springy - they do not disturb the top layers of bark of trees and shrubs. Thanks to the use of unique recipes, they are protected against UV radiation, temperature fluctuations and general aging of the material. In addition, they do not absorb water, they are resistant to bacteria, fungi and molds, and also to plant protection products.

We are convinced that among the wide range of our products you will choose the one that meets your expectations in 100%.

We invite you to contact our office!
